IN THE CLAIMS

Please amend claims 1, 12 and 33, as set forth below.

The present listing of the claims replaces any prior listing and upon entry of the present

amendment, the status of the claims will be as follows:

1. (Currently amended) A solid gel matrix comprising a combination of a solid gel suitable

for separation of biomolecules within the gel by electrophoresis or magnetophoresis and one or

more SERS-enhancing nanoparticles contained in the gel, the SERS-enhancing nanoparticles

having an attached probe that binds specifically to an analyte.

2. (Original) The gel matrix of claim 1 comprising a plurality of the nanoparticles to

provide a plurality of unique optical signatures.

3. The gel matrix of claim 2, wherein the SERS-enhancing nanoparticles

comprise one or more Raman-active tags independently selected from the group consisting of

nucleic acids, nucleotides, nucleotide analogs, base analogs, fluorescent dyes, peptides, amino

acids, modified amino acids, organic moieties, quantum dots, carbon nanotubes, fullerenes, metal

nanoparticles, electron dense particles and crystalline particles.

4. (Original) The gel matrix of claim 1, wherein at least one of the nanoparticles has a net

charge.

5. (Original) The gel matrix of claim 1, wherein the nanoparticles each provide a unique

SERS-signal that is correlated with binding specificity of the probe of the nanoparticle.

6. (Original) The gel matrix of claim 1, wherein the Raman-active tag comprises adenine or

an analog thereof.

(Original) The gel matrix of claim 1, wherein the nanoparticles are composite organic-7.

inorganic nanoparticle (COINs) comprising a core and a surface, wherein the core comprises a

metallic colloid comprising a first metal and a Raman-active organic compound.

8. (Original) The gel matrix of claim 7, wherein the COINs further comprise a second

metal different from the first metal forming a layer overlying the surface of the nanoparticle.

9. (Original) The gel matrix of claim 8, wherein the COINs further comprise an organic

layer overlying the metal layer, which organic layer comprises the probe.

10. (Original) The gel matrix of claim 1, wherein the probe is selected from antibodies,

antigens, polynucleotides, oligonucleotides, receptors and ligands.

(Original) The gel matrix of claim 10, wherein the probe comprises a polynucleotide. 11.

(Currently amended) The gel matrix of claim 1, wherein at least some any of the 12.

nanoparticles may further comprise a fluorescent label that contributes to the optical signature.

13-32. (Canceled)

33. (Currently amended) A system for detecting an analyte in a sample comprising:

a gel matrix comprising a combination of a solid gel suitable for separation of

biomolecules within the gel by electrophoresis or magnetophoresis and one or more SERS-

enhancing nanoparticles contained in the gel, the SERS-enhancing nanoparticles having an

attached probe that binds specifically to an analyte;

a sample containing at least one analyte; and

an optical detection system suitable for detecting SERS signals from the nanoparticles.

34. (Original) The system of claim 33, further comprising a computer comprising an algorithm for analysis of the SERS signals obtained from the sample.

35-40. (Canceled)
